In the Abstract:

The paragraph beginning at page 28, line 2 has been amended as follows:

~~The present comprises an~~ An electrode having the configuration: first active material/current collector/second active material is described. One of the electrode active materials in a cohesive form of active particles in a cohesive form being firmly held together as part of the same mass is incapable of moving through the current collector to the other side thereof. However, in an un-cohesive form of active particles not being firmly held together as part of a mass, the one electrode active material is capable of communication through the current collector. The other or second active material is in a form in-capable of communication through the current collector, whether it is in a cohesive or un-cohesive powder form. Then, the assembly of first active material/current collector/second active material is pressed from either the direction of the first electrode active material to the second electrode active material, or visa versa.
